Assigned Challenge

Challenge 1 – Volunteer Workers at Concession Stands

The operations team at the stadium has been approached by a volunteer group that has the mission to work in the public domain to serve the community. The volunteers of this group would give their time to work at the registers of the concession stands and fulfill orders. These workers would only be located at concession stands and would not be considered in other areas of the stadium. Due to the inexperience of these volunteer workers, it is assumed that they would only have 50% of the efficiency that the trained staff would have to take and fulfill orders. Determine if it would be financially and operationally viable to have the volunteer group work at the concession stands instead of the trained workers.

Performance Objectives

The default cashier hourly wage is 16$. So the total amount of money lost should be equal to or less to around 40$ per replaced cashier. As a bonus objective, we should try to find when the number of lost customers is not a significant difference as a loss of those may decrease our reputability and may lead them to not coming back at all.

Related Measurements

We need to track the number of sales made in order to create these calculations. Alongside this, we should track how long the average waiting time changes between the different experiments for the bonus objective.
